

Replication

The training procedure is not deterministic, so you will not be able to train exactly the same model as the one provided (*tensorflow-example.pt*). It is still possible to use the provided model to get reproducible predictions on unseen text. The instructions for such are as follows:

- First run `./setup.sh` if you have not already done so.
- Run `./evaluate.sh tensorflow-example.pt text.txt` or with any other text file to predict the sentiment if it was the title and body of a bug report.
- Run `./evaluate.sh tensorflow-example.pt` to predict the sentiment of standard input if each line of input was its own individual bug report.
- To train your own model the same way, run a command such as `./evaluate.sh tensorflow 100`.
 - Note that this is an instruction to repeat the training process 100 separate times, which may take a long time (30 minutes for me).
 - Metrics on all 5 of the provided datasets were ran with the default 10 runs.
